CIED Discussion Guide
For patients & caregivers

If you have a cardiac implantable electronic device (CIED), this guide is for you.

What do I do if I have an infection?

The doctor will do tests to confirm infection. If the tests are positive, your doctor will discuss treatment options with you and together you can make a plan if the device and leads need to be removed.

If the device is not removed, the chance of getting another infection is between 50 and 100%.

Early detection and removal saves lives

How do I know if I have a CIED infection?

Each infection may look different. You may be able to see the infection on your skin, but sometimes there are no visible signs. You may have symptoms though.

Symptoms
- Fever
- Chills
- Nausea
- Sweating
- Fatigue
- Redness of the skin
- Pain or tenderness near device
- Swelling, warmth or a "hot" feeling
- Blood or drainage at the incision site
- Erosion of the device through the skin

If you have a CIED and any of these symptoms, contact your healthcare provider right away!

What is a CIED infection?

Infections with CIEDs can happen over time and are serious complications.

Today, many people have cardiac implantable electronic devices (CIEDs) such as pacemakers and defibrillators (IEDs). These devices are reliable and effective treatment options for many heart rhythm issues; however, patients should be aware of their risk of infection.

Did you know?

1 in 20 patients globally will get a CIED infection in the first 15 years

60,000 patients globally will get a CIED infection this year

Timely device extraction and lead removal for CIED infection lowers the risk of death by about 43%.

If you think you have an infection, contact your heart doctor as soon as possible! Your doctor may refer you to another specialist in device infection and extraction (removal).

The doctor will do tests to confirm infection. If the tests are positive, your doctor will discuss treatment options with you and together you can make a plan if the device and leads need to be removed. If the device is not removed, the chance of getting another infection is between 50 and 100%.
